

ABSTRACT OF THE DISCLOSURE

An automated Web security analysis system and process
20 identifies security vulnerabilities in a target Internet Web
site by parsing through the target Web site to search for a
predetermined list of common security vulnerabilities. The
process is recursive, exploiting information gathered
throughout the process to search for additional security
25 vulnerabilities. A prioritized list of detected security
vulnerabilities is then presented to a user, including
preferably a list of recommendations to eliminate the detected
security vulnerabilities.
